Trial Comments

COMMENTS: Determine tomato and pepper response to Reflex applied preplant under mulch.

VISUAL CROP INJURY:

1. Banana pepper injury (stunting) was at most 7% with all treatments, even with 48 oz/A of Reflex.
2. Tomato was more sensitive than pepper. At 3 wk after transplant, Reflex at 48 oz was causing 20% stunting with all other treatments causing 5% or less. By 4 wk after transplant, Reflex at 20 to 32 oz caused 5 to 8% stunting with Reflex at 48 oz stunting tomato 25%. No stunting from any treatment was noted by 7 wk after transplant.

VISUAL NUTSEDGE CONTROL:

1. By 3 wk after preplant treatments (4/8/10), less than 50% control was noted with Reflex at 20 oz/A or less; 53 to 57% control was noted with 24 to 32 oz, and 70% control was noted with 48 oz.
2. Reflex is not as effective applied under mulch as applied to bare soil; however, Reflex in combination with a fumigant system would likely be very effective in controlling nutsedge.

PLANT HEIGHTS:

1. Twenty pepper plants per plot were measured 3 times during the season. No height differences were noted.
2. Ten tomato plants per plot were measured 3 times during the season. Reflex at 48 oz did reduce tomato height 10% compared to the control just prior to harvest.

PEPPER YIELDS:

1. Jumbo pepper were harvested four times by a growers crew.
2. No treatment impacted yield. A trend for lower fruit were noted in the control which may have been a response to nutsedge, although populations were light enough a yield loss would not have been expected.

TOMATO YIELDS:

1. Tomato were harvested seven times as soon as they started turning. Each time fruit were graded according to USDA standards.
2. When comparing individual fruit sizes over the 7 harvest there were no losses in yield due to treatment.
3. Also when adding all fruit sizes and harvest dates, Reflex did not impact yield.

GENERAL COMMENTS:

1. Forty pepper plants per plot and 10 tomato plants per plot.
2. All plants were harvested each time.
